SUMMARY

Skilled Python Developer with 3+ years of experience in designing, developing, and maintaining web applications using Flask, Django, and FastAPI. Expertise in modern Python libraries, database management (PostgreSQL, MySQL, MongoDB), and cloud platforms (AWS,). Proven track record in backend development, API design, and process automation. Strong understanding of containerization and infrastructure as code. Successfully delivered multiple projects in the automation and employee management domains. .

Education

Government Engineering College, Bhuj
Bachelor of Technology CGPA: 7.2

2016 – 2020

PROFESSIONAL EXPERIENCE

Koli Infotech

Senior Python Developer

July 2023 – Present

- Designed and implemented Python-based automation workflows for Control Case and Enhanced the security and proficiency
- Reduced manual efforts by automating the report generation process
- Built a secure and modular backend using FastAPI, with integrated payment handling, user authentication, and dynamic certificate generation
- Developed an automated web scraping tool using Selenium and Beautiful Soup to extract contact details from websites based on company names listed in Excel. Created a full pipeline including a user-friendly front end with HTML, CSS, JavaScript, and Bootstrap for efficient data retrieval and export.

Softices

junior Python Developer

Jan 2023 – Sep 2023

- Built a role-based NGO Management System using Django with modules for managing donations, events, projects, and user roles like NGOs, volunteers, donors, and staff.
- Performed data cleaning, preprocessing, and analysis using Pandas and NumPy
- Gained experience with version control (Git), SQL queries, and API integration
- Focused on writing modular, reusable Python code following best practices
- Mechanized the extraction and processing of large datasets from legacy systems using SQL and Perl scripts

Projects

Techup (LMS)

May 2025 – Present

- Upgraded and Constructed *TechUp*, a scalable Learning Management System enabling users to purchase courses, manage memberships, and receive auto-generated certificates upon completion.
- Enforced a tiered subscription model to control course access based on user membership plans.
- Built backend APIs using FastAPI, ensuring high performance and modular structure.
- Integrated secure authentication using JWT and handled user/course data through RESTful endpoints.
- Streamlined certificate generation and purchase workflows, improving user experience and operational efficiency.
- Tools used: FastAPI (Backend), Python, SQLite, REST APIs, JWT Authentication.

Control Case

Jan 2024 – May 2025

- Transitioned core infrastructure from a Laravel monolith to AWS, improving scalability and availability.

- Programmed manual audit processes using Python APIs, reducing time and human error in compliance checks.
- Optimized serverless workflows using AWS Lambda and Step Functions for seamless process automation.
- Managed data with DynamoDB and RDS, ensuring high availability and fault tolerance.
- Secured the infrastructure with VPC, IAM roles, and least-privilege access control principles.
- Tools Used: AWS (Lambda, Step Functions, DynamoDB, RDS, S3, VPC, IAM, SNS, CloudWatch), Python, REST APIs

NGO Management System

June 2023 – Jan 2024

- Elevated and Generated a role-based web application to streamline operations for NGOs, volunteers, donors, and staff, with custom dashboards and permissions.
- Established user authentication, registration, and password reset via OTP-based email verification for secure access across roles.
- Each role may monitor and control pertinent data through integrated dashboards, which enhances operational openness and clarity.
- Utilized Django's admin panel for backend management and seamless content updates.
- Built CRUD modules for managing donations, events, projects, and staff/volunteer activities.
- Tools Used: Django, Python, SQLite, HTML, CSS, JavaScript, Bootstrap, Django Templates, SMTP (for email OTP)

Web Scraping Automation Tool

March 2023 – Sep 2023

- Assembled a custom web scraping solution to extract contact details (email addresses, phone numbers) from websites using a provided list of company names in Excel.
- Robotized the entire data pipeline — from reading Excel input to outputting results back into Excel after extraction.
- Integrated dashboards to allow each role to view and manage relevant data, improving clarity and operational transparency.
- Utilized Selenium for dynamic page interaction and BeautifulSoup for precise HTML parsing and data extraction.
- Enhanced data collection speed and accuracy, significantly improving productivity in lead generation and business intelligence.
- Tools Used: Python, Selenium, BeautifulSoup, OpenPyXL (or Pandas for Excel I/O), HTML, CSS, JavaScript, Bootstrap

Technologies

Programming Languages : Python (Basic Python Advance Python, OOPS)

Frameworks & Libraries : Django, Flask, Fast-API, DRF, Frappe, NumPy, Pandas, BeautifulSoup, Selenium, Requests.

Cloud : AWS (Lambda, S3, ECS, EKS, Cloud Watch, Step Functions, IAM, Secret Manager, VPC), Docker, CI/CD Pipelines

Databases : PostgreSQL, MySQL, MongoDB, Oracle SQL, SQLite, Redis

Tools : Git, Postman, Jira, VS Code, Docker, Kubernetes

Concepts : REST APIs, Microservices, OOP, Agile Methodology
